

Iranian & Tiger Sharks

Iranian Sharks

Iran is home to a variety of shark species, particularly in the Persian Gulf and the Caspian Sea. The Persian Gulf, with its warm and shallow waters, hosts several species of sharks, including the notorious bull shark, which can live in both fresh and saltwater. Unfortunately, shark populations in the Persian Gulf have been declining due to overfishing and environmental changes.

Tiger Sharks

Tiger sharks are one of the most well-known and feared shark species. They are large, powerful predators that can grow up to 4 meters (13 feet) in length. Known for their distinctive dark stripes, which fade as they age, tiger sharks are found in many warm, tropical, and temperate waters around the world, including the Persian Gulf. They are opportunistic feeders, consuming a wide variety of prey, from fish and seals to birds and even inanimate objects.

Tiger sharks are considered dangerous to humans due to their size and predatory nature, but attacks are relatively rare. They play a crucial role in

marine ecosystems by helping to maintain the balance of species populations.
